Job Description of DevOps AWS for Zemoso Labs

Title: DevOps AWS

Location: Bangalore, Pune

Job Description:

Key Responsibilities

Cloud & Infrastructure Management

- Design, provision, and manage cloud infrastructure on AWS.
- Develop and manage Infrastructure as Code (IaC) with a heavy focus on AWS CloudFormation (and Terraform).
- Configure and manage AWS IAM policies, roles, and permissions to ensure secure and cost-effective architectures.
- Manage and support a diverse infrastructure landscape, including data pipelines and Windows hosts.

Containers & Orchestration

- Orchestrate and scale workloads on Kubernetes, specifically Amazon EKS.
- Build, deploy, and manage containerized applications using Docker, focusing on image creation and optimization.
- Package and maintain applications using Helm Charts.

CI/CD & Automation

- Manage workflows using GitHub (mandatory) and GitLab, emphasizing advanced branching strategies and code reviews.
- Design and implement robust CI/CD pipelines using GitHub Actions, Jenkins, or Concourse.
- Develop automation scripts using Python, Bash, or PowerShell to improve deployment consistency.

Monitoring, Support & Fundamentals

- Perform Linux administration tasks.
- Troubleshoot build, deployment, and runtime issues in production environments.
- Monitor infrastructure and application health using Grafana and Prometheus.
- Apply deep foundational knowledge of networking, storage, IAM, certificates, logs, and containers to resolve operational failures.

Core Traits & Work Style (Must-Haves)

- **Self-Learning Autonomy:** Must be comfortable reading official AWS documentation, interpreting unfamiliar infrastructure setups, and learning deeply without requiring handholding.
- **System Comprehension & Mental Models:** Ability to inspect existing code/configuration, reason about component interactions, and build accurate mental models to debug issues rather than blindly following commands.
- **Documentation-First Mindset:** Knows when to rely on official documentation/reference materials for production work versus using tutorials. Maintains a low dependency on AI tools (like Copilot) for core troubleshooting, relying instead on reading docs, searching logs, and understanding command outputs.
- **Intelligent Problem-Solving:** Asks thoughtful, context-aware questions. A strong attention to detail is required to notice small discrepancies, reason out why something failed during setup or configuration, and diligently follow complex instructions.

Qualifications & Skills

- **Education:** Bachelor's degree in Computer Information Science, Engineering, or equivalent practical experience.
- **Experience:** 5+ years of overall IT/DevOps experience, including at least 3+ years specifically on AWS. (7+ years preferred for Senior level).
- **Cloud Platforms:** Strong hands-on expertise in AWS services.
- **CI/CD & Git:** Expert knowledge of GitHub Actions and Git-based workflows.
- **Data Systems:** Experience working with databases such as PostgreSQL and Elastic.

Good to Have

- Relevant AWS certifications.

- Background in application development (Java, Spring Boot) and build tools like Apache Maven.

- Experience with automated testing practices and supporting multiple team/client engagements.

What Success Looks Like in This Role

- Reliable, secure, and automated AWS infrastructure

- Scalable CI/CD pipelines adopted across teams

- Reduced manual effort through automation

- Strong collaboration between DevOps, security, and development teams

Experience: 4-8 years
